

ESD Customer Information

Name and address: hawa GmbH
Industriestr. 12
D-88489 Wain

Dissipative powder coatings

For products whose surfaces are subject to ESD requirements, hawa offers special electrostatic dissipative coatings. These powder coatings are processed strictly according to the manufacturer's specifications. This applies to the coating thickness, in particular.

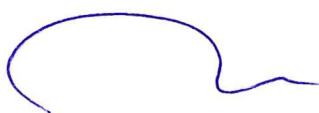

Generally, our powder coated surfaces are of excellent industrial quality. We would like to point out that the geometry of the final product and the coating process directly influence the coating thickness. Differences to the manufacturer's specifications may occur in the direct vicinity of cut-outs, edges, and at welded joints.

We cannot accept any liability for a continuous, uniform coating thickness on the entire product and the resulting dissipative capacity within the manufacturer's specifications.

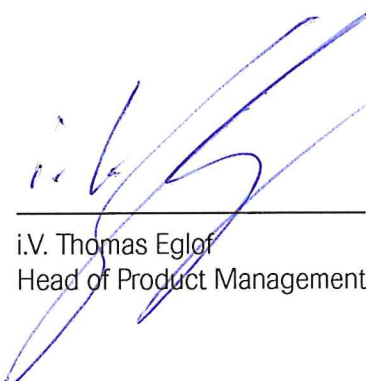

Upon request, we will gladly provide you with an offer for an ESD measurement on your product, including documentation.

Measurements are carried out in accordance with DIN EN 61340-5-1 electrostatic - protection of electronic components and DIN EN 61340-2-3 electrostatic - test methods. Our measuring equipment complies with the specifications of DIN EN 61340-2-3. Any further liability based on the result of the test is excluded, as it is just a snapshot at the time of testing.
